

drive update FUJITEC CONTROLLERS

Buildings installed with original Fujitec *Exceldyne*, *Talon* (MRL), *Millennium II* and *Millennium III* (geared traction) controllers have an available update to extend service life by planned, pro-active repair and replacement of major components. Fujitec is updating these systems with new model drives and CPU's where applicable. CPU upgrades are available to CP40.

Overview

SYSTEMS AVAILABLE FOR UPDATE:

- Exceldyne
- Talon
- Millennium
- Millennium II

BENEFITS

- Increases processing speed
- Proactively mitigates downtime*
- Provides an effective solution to improve service reliability and performance when full modernization is not budgeted.

**(As years in service on equipment accumulate, the risk of unnecessary downtime due to component failure naturally increases. In addition to the constraints of parts/component availability, software programming and physical adjustments are required to complete repairs. Proactively managing these adjustments ensures your elevators will remain in operation with minimal scheduled downtime.)*

CONSIDER GOING GREEN

- **Consider a Re-Gen Drive Solution:** Re-Gen acts as a line-power inverter by capturing energy produced by the elevator during over-hauling load conditions and recycling it back into the power grid. The solution reduces your system's energy consumption and can provide points toward LEED certification.
